

User Guide

GObject Editor UI for AzerothCore

Overview

GObject Editor UI is an in-game addon and AzerothCore module tool for placing, editing, moving, saving, restoring, and deleting GameObjects and NPCs directly inside the WoW client.

The tool is designed for controlled scene-building and world-editing work from inside the game without needing to manually type repeated `.gobject` or `.npc` commands.

Requirements

Server

This tool requires the matching AzerothCore module:

```
mod-gobject-editor
```

The server module must be compiled and active on the worldserver.

Client

The addon folder must be installed in:

```
World of Warcraft\Interface\AddOns\GObjectEditorUI
```

The addon can be opened with:

```
/gobedit
```

or by clicking the minimap button.

Opening the Editor

You can open the editor in two ways:

Slash Command

```
/gobedit
```

Minimap Button

Click the **GObject Editor** minimap icon to open or close the main editor window. The minimap button can be dragged around the minimap.

Main Editor Layout

The editor is split into several working areas:

Session Controls

Used for scanning, deleting, undoing, saving, restoring, and resetting selected objects or NPCs.

- Search
- Delete
- Undo
- Reset
- Face Me
- Save to DB
- Restore Saved Position

Objects in View

This list shows nearby editable objects after using **Scan Radius**.

Rows are labeled by type:

[GOBJ]	GameObject
[NPC]	NPC / Creature

Click a row to select it for editing.

Movement Controls

Used to nudge the selected GameObject or NPC.

- Forward
- Back
- Left
- Right
- Up
- Down

Rotation Controls

Used to rotate selected GameObjects.

- Yaw Left
- Yaw Right
- Pitch Forward
- Pitch Back
- Roll Left
- Roll Right

NPCs do not support the rotation buttons. For NPC facing, turn your character before placing the NPC.

Scanning Nearby Objects and NPCs

Use **Scan Radius** to find editable GameObjects and NPCs near your character.

How to Scan

- Enter a radius value.
- Press **Enter** or click **Scan Radius**.
- Results appear in **Objects in View**.

Example radius:

50

The scan list shows both GameObjects and NPCs:

```
[GOBJ] 5300712  Wooden Chair
[NPC] 5300718  Stormwind Citizen
```

Search & Place GameObject / NPC

Click **Search** to open the **Search & Place GameObject / NPC** window.

This window lets you search database templates and place new GameObjects or NPCs into the world.

GameObject Search

By default, the search window searches GameObjects.

You can search by name:

chair

or by exact entry number:

2695

The result list shows matching GameObject templates. Selecting a result displays Entry, Name, Type, DisplayID, and Preview. Click **Place** to place the selected GameObject into the world. GameObjects are placed slightly in front of your character so they are easy to see and edit.

NPC Search

To search NPCs, check:

Search NPCs

Then search by name:

citizen

or by exact entry number:

1723

Click **Place** to place the selected NPC. NPCs are placed at your character's current position and use your character's current facing direction. Turn your character before placing an NPC to control its starting direction.

Preview Window

The Search & Place window includes a preview panel.

GameObject Preview

GameObjects use the model path provided by the server and generally preview reliably.

NPC Preview

NPC preview is best-effort.

Some NPC textures may not load correctly in the preview window, even when the NPC looks correct after being placed in the world. This is a preview-only limitation. If the NPC appears correctly in-world after placement, the NPC itself is valid.

Preview Controls

The preview panel includes text controls:

< > + - Reset

Controls

Control	Action
<	Rotate preview left
>	Rotate preview right
+	Zoom in
-	Zoom out
Reset	Reset preview rotation and zoom

You can hold <, >, +, or - to continuously rotate or zoom without repeated clicking.

A vertical slider on the right side of the preview panel adjusts the preview model position.

Moving Objects and NPCs

Select an item from **Objects in View**, then use the movement buttons.

Supported Movement

GameObjects and NPCs support:

Forward
Back
Left
Right

GameObjects also support vertical adjustment:

Up
Down

NPCs are grounded creatures. Moving an NPC up may cause it to fall back to the ground, and moving down may be blocked by terrain.

Object Move Checkbox

The editor includes an **Object Move** checkbox.

Unchecked

Movement uses your character's facing direction.

Forward = your character's forward direction

Checked

Movement uses the selected GameObject or NPC's own orientation.

Forward = selected object/NPC's forward direction

This lets you choose between player-relative movement and object-relative movement.

Undo, Save, Restore, and Reset

Undo

Undo reverses the last movement step for the selected object or NPC.

Save to DB

For GameObjects, this saves the edited position to the database. For NPCs, this marks the current position as the saved restore point.

Restore Saved Position

Restores the selected object or NPC to the last saved position.

Reset

Resets the selected object or NPC back to its original position from when it was selected or scanned. This is useful if you move something too far and want to return to the starting point without clicking Undo many times.

Delete

The **Delete** button removes the currently selected GameObject or NPC.

There is no confirmation prompt.

Only click Delete when you intend to remove the selected item.

After deletion, the scan list refreshes so the deleted object or NPC disappears from **Objects in View**.

Controls Only Popout

The **Controls Only** popout provides a smaller editing panel.

It includes:

- Movement controls
- Rotation controls
- Undo
- Delete
- Reset
- Step field
- Object Move checkbox
- Selected object/NPC info

This is useful when you want more screen space while editing.

Keyboard Behavior

Text fields support Enter and Escape behavior.

Enter

Pressing **Enter** in a field applies that field's action and clears focus.

Examples:

```
Search field → runs search
Scan Radius field → runs scan
Step field → applies step value
```

Escape

Pressing **Escape** clears focus from the active text field.

Click Sound

The addon supports a custom click sound:

```
GObjectEditorUI\Sounds\ButtonClick.ogg
```

If the sound is too loud, lower the volume of the .ogg file itself and keep the same filename/path.

Notes and Limitations

NPC Rotation

NPCs do not support the GameObject rotation buttons. To control NPC facing, turn your character before placing the NPC.

NPC Preview Textures

Some NPCs may appear white or untextured in the preview window. If the NPC looks correct after being placed in the world, the issue is only with the preview window.

NPC Vertical Movement

NPCs are normal grounded creatures. Vertical movement may be limited by terrain and creature movement behavior.

Recommended Workflow

Placing a GameObject

- Open the editor.
- Click Search.
- Search for a GameObject by name or entry.
- Select the result.
- Preview it.
- Click Place.
- Scan if needed.
- Select the placed GameObject.
- Move or rotate it.
- Click Save to DB.

Placing an NPC

- Open the editor.
- Click Search.
- Check Search NPCs.
- Search for an NPC by name or entry.
- Select the result.
- Turn your character to the desired facing direction.
- Click Place.
- Scan if needed.
- Select the placed NPC.
- Move it if needed.
- Click Save to DB to mark the restore point.

Troubleshooting

The addon does not open

Make sure the addon is installed in:

```
World of Warcraft\Interface\AddOns\GObjectEditorUI
```

Then reload the UI or restart the client. Use:

```
/reload  
/gobedit
```

Search does not return results

Check that the server module is active and that you have access to the editor. For NPC search, make sure **Search NPCs** is checked.

NPC preview is white

This can happen with the preview window. Place the NPC in the world to verify how it actually looks.

Movement does not affect the expected direction

Check the **Object Move** checkbox. Unchecked movement follows your character's facing direction. Checked movement follows the selected object or NPC's orientation.

NPC does not rotate

NPCs do not support rotation buttons. Turn your character before placing the NPC.
